

Aurora Blueberry

Vaccinium corymbosum 'Aurora'

Height: 6 feet

Spread: 6 feet

Sunlight: ☉ ●

Hardiness Zone: 4b

Group/Class: Highbush Blueberry

Description:

A popular shrub noted for its reliable yields of tasty fruit very late in the season; pretty bell-shaped flowers in late spring, bushy, upright, and fast growing; blueberries need highly acidic soil, perfect drainage and mulch; plant with peat moss

Edible Qualities

Aurora Blueberry is a medium-sized shrub that is typically grown for its edible qualities. It produces clusters of blue round berries which are usually ready for picking from late summer to early fall. The berries have a sweet taste and a juicy texture.

The berries are most often used in the following ways:

- Fresh Eating
- Cooking
- Baking
- Preserves

Features & Attributes

Aurora Blueberry features dainty clusters of white bell-shaped flowers hanging below the branches in late spring. It has green deciduous foliage. The glossy oval leaves turn yellow, red and purple in fall. It features an abundance of magnificent blue berries in late summer. The smooth brick red bark and yellow branches add an interesting dimension to the landscape.

This is a multi-stemmed deciduous shrub with an upright spreading habit of growth. Its average texture blends into the landscape, but can be balanced by one or two finer or coarser trees or shrubs for an effective composition. This is a relatively low maintenance plant, and usually looks its best without pruning, although it will tolerate pruning. It is a good choice for attracting birds to your yard. It has no significant negative characteristics.

Aside from its primary use as an edible, Aurora Blueberry is suitable for the following landscape applications;

- Orchard/Edible Landscaping

Planting & Growing

Aurora Blueberry will grow to be about 6 feet tall at maturity, with a spread of 6 feet. It tends to be a little leggy, with a typical clearance of 1 foot from the ground, and is suitable for planting under power lines. It grows at a fast rate, and under ideal conditions can be expected to live for approximately 30 years. This variety requires a different selection of the same species growing nearby in order to set fruit.

This shrub is typically grown in a designated area of the yard because of its mature size and spread. It does best in full sun to partial shade. It does best in average to evenly moist conditions, but will not tolerate standing water. It is very fussy about its soil conditions and must have sandy, acidic soils to ensure success, and is subject to chlorosis (yellowing) of the foliage in alkaline soils. It is quite intolerant of urban pollution, therefore inner city or urban streetside plantings are best avoided, and will benefit from being planted in a relatively sheltered location. Consider applying a thick mulch around the root zone in winter to protect it in exposed locations or colder microclimates. This is a selection of a native North American species.
